EYE LEVEL &
LOW LEVEL DUSTING

www.lambskin.com

Regular dusting is part of an on-going dust prevention and remediation program. And no surface is safe – from floor to ceiling and wall to wall; in homes, offices, schools, hotel lobbies, guest rooms, airports, malls, convention/meeting facilities, places of worship, retail settings and restaurants – dust settles everywhere. **Dust is unsightly, indicates poor cleaning practices, and is a threat to health.**

Studies have shown **dust is a mixture of various components** including human skin flakes, decomposing insects, lint, organic clothing fibers, tracked-in soil, particulate matter and paper fibers. Researchers **found in more than 90 percent of collected dust samples traces of harmful chemicals including phthalates, phenols, replacement flame retardants (RFRs) and synthetic fragrance.** Additionally, scientists have discovered **dust contains around 9,000 different microbes**, including 7,000 types of bacteria and 2,000 varieties of fungi.

Walk-off mats and vacuums can only do so much. **Effective dusting tools are required to finish the job.**

The fact is, there is **no single dusting product that can solve every dusting challenge. It has to be the right material, the right shape, the right height, and the right design.** Fortunately, Lambskin Specialties offers products created to meet these challenges.

Lambswool – Attracts and holds dust with a natural static charge, web of fibers and lanolin oil. Ideal for collecting fine dust on broad surfaces.

Feathers – Grabs dust with tiny ‘hairs’ on the edge of the feather. The higher the quality of feather, the more fibers there are to come in contact with dust particles. Ideal for delicate and fragile surfaces.

Synthetics – Made from nylon or polypropylene fibers. The stiff nylon fibers are ideal for grabbing spider webs.

Microfibers – Available as a cloth, duster, or for floor dusting. Microfiber is engineered for maximum surface contact. It is particularly effective on heavy dust build-up.

Disposables - Available as a mitt, duster sleeve, or floor dusting sheet. The duster sleeves are particularly effective for heavy dust build-up. The mitt is for small surfaces, railings, or for testing for dust. The sheets are ideal in medical facilities, lobbies, and other large spaces.
